1. Reference and variant sequence
65 kb window, both strands
2. Evo 2 7B, weights frozen
hidden state of block 27
3. Keep the 256 positions per strand
where reference and variant
differ most (cosine)
Trained on ClinVar SNV labels;
5 gene partitions, each predicted
by a probe that never saw its genes
4. Variant minus reference,
covariance pooling (trained)
5. Linear readout to
P(pathogenic) (trained)
